GOOGLE FORM PACK

Copy into the submission form

Form: https://forms.gle/xEtJSgJfeqvnxv8q6 — 48-hour window. Strong submissions skip to the final Growth Interview. Paste these, attach the PDFs, record the 3-minute video from the script page.

1. Growth Plan

Google Drive / Notion / Canva / PDF. Max 5 slides / 2 pages.

Copy

Use the live Growth Plan page and the PDF on this site (2 pages). After you publish the app, paste that public URL here. Until then, download NxtWave-Growth-Plan-SHIP60.pdf from the Growth plan page and upload it to Drive as anyone-with-link.

2. Working Asset Link

Landing page / live page / prototype.

Copy

This app is the working asset: SHIP60 — workshop landing + ResumeFit demo + seat ticket + WhatsApp referral loop + captain kit. After publish, paste the live URL. Reviewers should: pick a branch, score a resume, take a seat, copy the WhatsApp message.

3. Your 3 Tests

Hypothesis → what you would test → metric.

Copy

T1 Headline
Hypothesis: A GitHub/project frame converts at least 2× a 'learn AI' frame, because the job-to-be-done is a resume artefact, not education.
What I would test: 50/50 split on the landing hero for 48 hours. A: 'Learn AI in 60 minutes'. B: 'Walk out with a GitHub project tonight'.
Metric: Register CVR (seats / unique landing sessions). Kill A if B ≥ 1.6× after 400 sessions.

T2 Share loop
Hypothesis: A post-register ticket with a one-tap WhatsApp message produces k ≥ 0.6. A thank-you page without a share object produces k ≈ 0.1.
What I would test: After seat 1–150, show the ticket + copy-ready class message. Measure invites sent and 2nd-degree seats.
Metric: k-factor = (invite taps × invitee CVR) / registrants. Kill the loop if k < 0.3 by end of Day 3 and switch to more captains.

T3 Branch-native project

Hypothesis: ECE/Mech students convert when the project is named for their week (placement, not 'ML pipeline'). CSE is already over-workshopped.
What I would test: Landing branch picker changes the proof line. Compare ECE+Mech CVR vs CSE CVR vs a generic control in 3 captain groups.
Metric: CVR by branch. Success: non-CSE CVR within 20% of CSE. Fail: non-CSE < half of CSE — then we were still talking like a coding bootcamp.

4. AI Worklog

Prompt → AI output → changed/rejected → final. URL or short answer.

Copy

Live page: /worklog on this app, plus NxtWave-AI-Worklog-SHIP60.pdf.

1) Asked how to get 500 regs in 7 days with ₹2,000. AI suggested ads + 12 channels + 'Learn AI' headline. Rejected: ₹4/seat math kills ads; brief said prioritise. Final: 50×10 flywheel.

2) Asked for a persona. AI gave generic CSE Gen-Z. Rejected: CSE is over-workshopped. Final: Rishika, ECE, GRIET, 0 repos, Thursday placement talk.

3) Asked what to build. AI suggested chatbot + Figma kit. Rejected: students open forwards, not new bots. Final: SHIP60 ticket + WhatsApp script as the salesforce.
